Product overview · 01 / 02

Leave daily planning to Rotaris. Build routes automatically.

Assign jobs to eligible teams and put visits in order automatically. Your office follows the day in one dashboard; technicians see their next address on their phones.

Routes and visit order · actual demo panel · Demo data from 23 October 2026

Web dashboard for the office · Android app for the field

Office

Follow the daily plan and manage changes.

Field team

Open the job, complete the form and save the result.

Management

Review completed work, time spent and outstanding balances.

Four steps to follow as you watch

1. The office plans the job
2. The team makes the visit
3. Results and amounts are recorded
4. The manager reviews the day

Screenshots show the Turkish product interface.

Getting started · 02 / 02

How does your day start?

From fault report to service record

A door motor fault is linked to the customer, the entrance address and the equipment record.

From scheduled maintenance to the next visit

Bring together the equipment's maintenance date, its checklist and previous work.

Several visits in a single day

Different customer addresses and devices remain distinct as they join the teams' daily plan.

A concrete checklist for getting started

You prepare

- Branches, teams and user roles
- A blank service form and job types
- A sample job list without personal data, if available

We configure together

- Form fields, outcomes and document settings
- Shift, depot and routing rules
- Inventory and collection options to use

We check the first use

- The example job reaches the right team
- Phone form, signature and sync state
- Result, PDF and report record in the panel

We'll agree the setup scope based on your existing files and workflow.

Let's start with a plan that fits your team.

Tell us about your process; let's explore it together.

These examples explain existing capabilities; form fields and maintenance rules depend on company settings.
